TOTO®

EcoPower® HE Toilet Flush Valve

TET1(6)LB(X) - 1.28gpf

Planet-friendly, superior flushing performance is easy to achieve with the EcoPower High Efficiency Toilet Flushometer Valve. Engineered to require no electricity or routine battery replacement, the EcoPower Flushometer Valve saves energy and water while providing maximum performance in even the most demanding commercial spaces.

Performance dashboard

Features & functionality

Self-powered hydroelectric flush valve system

Durable chrome plated body with tamper-proof screws and solid bronze valve body

Self-cleaning piston valve with 360° filter screenNeutral rough-in and adjustable tail piece connection

True mechanical flush override

Smart sensor with self-adjusting detection range

6-second detection time to prevent ghost flushing

Environment & materials

Improved by:

Powered by the sheer force of running water

Uses 20% less water than standard 1.6gpf valve

Metal parts and electric components are recyclable at the end of service

Certifications, rating systems & disclosures:

WaterSense® certified

CALGreen® compliant

Declare™ Label, LBC Compliant

Contributes to earning credits in LEED®

EcoPower® HE Toilet Flush Valve

LCA results & interpretation | EPD additional content | Material health

Scope and summary

○ Cradle to gate ○ Cradle to gate with options ● **Cradle to grave**

Functional unit

One flushometer valve for single flush toilets used in an average commercial environment over the estimated service life of the building. The expected service life (ESL) of a building is 75 years, and all use stage activity and impacts are accounted for in that full ESL period. The reference service life (RSL) of the flush valve is 10 years, which is an industry-accepted average lifespan based on the economic lifespan of the product.

Maintenance

Regular cleaning is assumed to use 10mL of a 1% sodium lauryl sulfate (SLS) solution daily in a commercial setting for 75 years, which is the building estimated service life. The use of 10mL/clean over 260days/year for 75 years gives a total of 195L of solution. Using a density of 1.01kg/L for a 1% SLS solution, 195kg of solution will be needed over the course of 75 years. Therefore, 2kg of SLS plus 195kg of water were included in the model.

Replacement

At the end of its RSL, the flush valve is assumed to be replaced. Therefore, an additional 6.5 products are included as replacements, with all life cycle modules considered, over the building's ESL of 75 years.

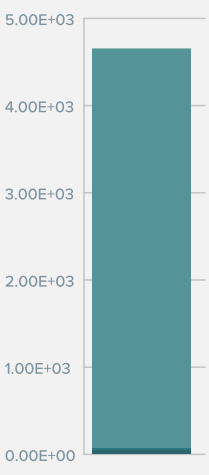
Manufacturing data

Manufacturing data has been collected and compiled for TOTO Vietnam.
Data reporting period: 2023.

Material composition by wt%

PART	MATERIAL	AVG. % WT
Valve body, cap & tailpiece	Bronze (C836000)	52.0%
Bottom and top covers	Zinc die cast	34.3%
Packaging	Carboard	5.55%
Manuals	Paper	1.32%
Tailpiece nut	Brass	1.03%
Generator coil	Copper	0.650%
	Other	5.15%

Total impacts by life cycle stage [mPts/func unit]



LIFE CYCLE STAGE	MPTS/FUNC. UNIT
Production	35.8
Construction	0.07
Use	4,553
End of life	0.02

Total impacts = 4,589 mPts
per 75 years installed

What's causing the greatest impacts

All life cycle stages

The use stage [B1-B7] dominates the results for all impact categories. The replacements module [B4] is highly dominant in all categories because of the amount of water consumed during operation and the necessity to consider an additional 6.5 products as replacements. All life cycle modules are considered throughout the estimated service life (ESL) of the building, which is 75 years. The production stage [A1-A3] itself is slightly significant but does not dominate in any impact category. Additionally, the processes associated with dismantling the product and final waste treatment during the end-of-life stage do not have a significant impact.

Production stage [A1-A3]

Bronze and zinc parts, together with the printed wiring board, have significant material contributions to the production stage. Stainless steel materials are relevant to the carcinogenics category. The electroplating process is a major contributor to the ozone depletion category while the die casting process is relevant to the ecotoxicity and non-carcinogenics categories. Because these products are manufactured in Vietnam but sold in the US market, the transportation via oceanic freighter appears as a relevant contributor to the fossil fuel depletion and smog categories. The other parts and processes contribute between 3% and 15% of the overall impacts in the remaining categories.

Construction stage [A4-A5]

Installation of the product dominates impacts in the construction stage. Transportation by truck for delivery to the installation site contributes the most, and this stage contributes less than 1% of the total global warming potential impacts throughout the product's life cycle.

Use stage [B1-B7]

Product replacements dominate impacts in the use stage. The use stage itself dominates all impact categories (>97%) due to the consideration of an additional 6.5 products as replacements. The water consumed during use and embedded electricity used for the water supply are also contributors in this stage.

End-of-life stage [C1-C4]

The transportation to landfill dominates impacts in the end-of-life stage. Transportation and the processes for dismantling the product contribute to a relatively low portion (<1%) of total results for all impact categories.

Operational energy and water use

The flush valve uses 1.28 gallons of water per flush and is assumed to be used 90 times per day in a commercial environment. With commercial use at 260 days per year over 75 years, the flush valve uses a total of 2,246,400 gallons of water over its lifetime. An electricity factor of 0.000961 kWh per liter of water is used to represent energy for upstream municipal water collection, treatment, supply, and downstream management. This use stage electricity was modeled using a United States grid mix.

How we're making it greener

TOTO PeoplePlanetWater™ programs improving environmental performance

- Dual-Max®, E-Max®, Tornado Flush™, 1G®, and EcoPower® reduce water consumption in the use phase
- Energy efficiency programs optimize the firing process
- Modular packing methods increase the fill rate of a trailer, cutting down on the number of trips needed
- 100% of post-industrial ceramic waste is recycled

See how we make it greener

Download PDF SM Transparency Report/EPD

SM Transparency Reports (TR) are ISO 14025 Type III environmental declarations (EPD) that enable purchasers and users to compare the potential environmental performance of products on a life cycle basis. They are designed to present information transparently to make the limitations of comparability more understandable. Environmental declarations of products that conform to the same PCR and include the same life cycle stages, but are made by different manufacturers, may not sufficiently align to support direct comparisons. They therefore cannot be used as comparative assertions unless the conditions as defined in ISO 14025 Section 6.7.2. 'Requirements for Comparability' are satisfied. In order to support comparative assertions, this EPD meets all comparability requirements stated in ISO 14025:2006. However, differences in certain assumptions, data quality, and variability between LCA data sets may still exist. Any EPD comparison must be carried out at the building level per ISO 21930 guidelines, use the same sub-category PCR where applicable, include all relevant information modules, be limited to EPDs applying a functional unit, and be based on equivalent scenarios with respect to the context of construction works. Some LCA impact categories and inventory items are still under development and can have high levels of uncertainty. To promote uniform guidance on the data collection, calculation, and reporting of results, the ACLCA methodology (ACLCA 2019) was used.

Rating systems

The intent is to reward project teams for selecting products from manufacturers who have verified improved life-cycle environmental performance.

Data

Background This product-specific plant-specific declaration was created by collecting production data from the Vietnam location. All unit processes were modeled using primary data. Secondary data sources include those available in ecoinvent and USLCI databases. Literature data was used to fill any data gaps to complete the inventory. In the manufacturing of the products, secondary materials such as scrap metals and metal bars used to hold the primary products in place were partially incorporated in the manufacturing of the primary products but were not considered due to a lack of background data in the LCA model.

Allocation Allocations of multi-input and multi-output processes follow a mass-based approach in the collected data, which is the most appropriate for the unit processes modelled. Allocation approaches in the background data follow the ecoinvent methodology. No co-product allocations were made in the model.

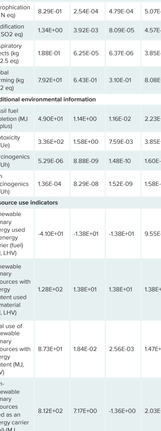
Cut-off criteria for the inclusion of mass and energy flows are 1% of renewable primary resource (energy) usage, 1% of renewable mass input of that unit process, and 1% of environmental impacts. The total of neglected input flows per module does not exceed 5% of energy usage, mass, and environmental impacts. The only exceptions to these criteria are substances with hazardous and toxic properties, which must be listed even if they are present in such low quantities that they are under the cut-off criterion of 1% of the total mass.

Flush valves include a lithium-ion battery which contains 1,2-Dimethoxyethane (CASF 110-71-4), a substance added to the SVHC Candidate List per the EU REACH Regulation. Because the battery is sealed, 100% of this hazardous substance is confined into the battery. A check was performed to ensure that the completeness of the overall material use is >99.0wt% of the finished product after cut-off, including the flush valve and packaging materials.

Data sets contributing 5% or more to any environmental impact category

Data set name	Database name and version	Software type and version	Geography	Allocation method
Zinc, primary, at regional storage	US-EI 2.2	SimaPro Analyst 9.5	Vietnam	By mass
Die casting, zinc	US-EI 2.2	SimaPro Analyst 9.5	China	By mass
Tap water, at user	US-EI 2.2	SimaPro Analyst 9.5	United States	By mass
Electricity, low voltage, at grid, Vietnam	US-EI 2.2	SimaPro Analyst 9.5	Vietnam	By mass
Heat, natural gas, at boiler modulating <100kW	ecoinvent v3.10	SimaPro Analyst 9.5	Vietnam	By mass

Flow diagram



The reported values for all indicators in the below tables for B1, B5, and C1 are zero.

Scenarios and additional technical information

Distribution [A4]

Plant location	Fairburn, GA
Distance (port of Savannah to plant)	406 km
Vehicle type	Diesel truck

In 2023, outbound shipments of flush valves from Fairburn were transported an average of 947 miles (1,524 km) by diesel truck and an average of 1,114 miles (1,793 km) by rail. The quantity transported by truck is 83%, and by rail 17%.

End of life [C1-C4]

The model reflects the assumptions that flush valves are 100% landfilled. The product is assumed to be transported 100 km via truck to final disposal.

However, it should be noted that many of the associated metal and plastic components follow the waste scenarios as listed in the table below. TOTO ceramic materials can be recycled as aggregate in several applications, although this is not currently common practice. Secondary materials, including shredded and sorted metal waste, are valuable goods that lose their status as waste after the sorting process. No additional waste processing is needed in that case, and no credits for material recovery are given.

Material	Potential waste scenario - Recycling	Potential waste scenario - Landfill
Brass, zinc, brass, copper	70.5%	29.5%
Corrugated board, paper	66.5%	33.5%
Plastics	15.0%	85.0%

Product information

Product code	ASTM or ANSI product specification	Physical properties and technical information
TET16LB(X)	ASSE 1037, CSA B125.3 (APMO),cULPC)	Commercial flushometer

Major system boundary exclusions

- Construction of major capital equipment, water & wastewater infrastructure
- Maintenance and operation of support equipment
- Human labor and employee transport
- Manufacture & transport of packaging materials not associated w/ final product
- Energy consumption in warehouses, distribution centers, and retail facilities during the course of transport to the final customer
- Disposal of packaging materials not associated with final product
- Building operational energy and water use

Major assumptions and limitations

- Transportation of all raw materials with the mass above 1% of the cumulative mass of the model, products from vendors, is estimated based on rail lines and port information.
- Pallet use is assumed based on the average numbers per unit of product and reported pallet quantity of specific models.

Data quality assessment

Precision: The precision of the data is considered high. Product engineers provided detailed bills of materials, and facility managers provided utility information for the manufacturing facilities. The raw material transportation distances were calculated based on the raw material manufacturers' addresses, extracted from the relevant SDSs.

Proxy datasets were utilized in the LCA model when secondary data were not available, as shown in Appendix A in the published LCA background report.

Completeness: The data included is considered complete. The LCA model included all known material and energy flows. As pointed out in that section, no known flows above 1% were excluded and the sum of all excluded flows totals less than 1%, whether evaluated by mass, energy, or potential environmental impact.

Consistency: The consistency of the model is considered high. The bills of materials provided by the product engineers were developed for multiple internal applications and are maintained regularly.

The LCA practitioner also cross-referenced the installation documents and other relevant information to ensure consistency. Furthermore, modeling assumptions were consistent across the model, with preference given towards SimaPro data, where available.

SUMMARY

Reference PCR
SM Part B: Commercial flushometer valves, v3.0

Regions; system boundaries
North America; Cradle-to-grave

Functional unit
One flushometer valve for single flush toilets in an average commercial environment over the estimated service life of the building of the building

LCIA methodology; LCA software; LCI database
TRACI 2.1; SimaPro Analyst 9.5; ecoinvent and USLCI databases

In accordance with ISO 14044 and the referenced PCR, the life cycle assessment was conducted by Sustainable Minds and critically reviewed by Jack Geibig (Ecoform) on behalf of NSF.

Evaluation programs

Declare

Declare labels are issued to products disclosing ingredient inventory, sourcing, and end of life options. Declare labels are based on the Manufacturers Guide to Declare, administered by the International Living Future Institute.

How it works

Material ingredients are inventoried and screened against the Living Building Challenge (LBC) Red List which represents the 'worst in class' materials, chemicals, and elements known to pose serious risks to human health and the greater ecosystem.

The Declare product database and label are used to select products that meet the Living Building Challenge's stringent materials requirements, streamlining the materials specification and certification process.

Assessment scope and results

Declare™

Inventory threshold: 100 ppm

Declare level:
The Declare product database and label are used to select products that meet the LBC's stringent materials requirements, streamlining the materials specification and certification process.

- LBC Red List Free
- LBC Red List Approved
- Declared

EcoPower® HE Toilet Flush Valve

Declare.

EcoPower® Exposed Toilet Flush Valve for 1.0 & 1.28gpf: TET1(6)UB(X) & TET1(6)LB(X)
TOTO USA

Final Assembly: Hanoi, Vietnam
Life Expectancy: 20 Year(s)
End of Life Options: Recyclable (93%), Portions Classified as Hazardous Waste, Landfill (7%)

Ingredients:

Parts: Zinc Alloy (Zamak 3); Polypropylene; Polyoxymethylene; Stainless Steel; Copper; Acrylonitrile Butadiene Styrene; Aluminum; Chromium VI; Ethylene Propylene Dienemonomer; FKM Polymer; Glass; High-Density Polyethylene; Magnet (Iron); Nitrile Rubber; **Valve Body:** Bronze; **Spout Body:** Brass; **Electrical Components:** Controller[1]; Battery[1]; Sensor[1]

[1]LBC Temp Exception RL-002 - Small Electrical Components

Living Building Challenge Criteria:

I-13 Red List:
☐ LBC Red List Free
☐ LBC Red List Approved
■ Declared

% Disclosed: 100% at 100ppm
VOC Content: Not Applicable

I-10 Interior Performance: Not Applicable
I-14 Responsible Sourcing: Not Applicable

TOT-0040
EXP. 01 AUG 2025
Original Issue Date: 2024

MANUFACTURER RESPONSIBLE FOR LABEL ACCURACY
INTERNATIONAL LIVING FUTURE INSTITUTE™ living-future.org/declare

What's in this product and why

Declare level

'Living Building Challenge Compliant' is achieved when the product contains Red List ingredients that have been given a temporary exception by the Living Building Challenge due to current market limitations.

What's in the product and why

The electronics used for flush valve operation include circuit board components. The controller, battery, and sensor allow for a self-powered hydroelectric flush valve system while also maintaining a true mechanical flush override. The electronic components are contained within the flush valve body and do not represent any hazards to the user.

The TOTO facility in which the valve is manufactured is ISO 14001 certified. This means that the facility has implemented an environmental management system as part of TOTO's commitment to the health of the environment.

Where it goes at the end of its life

TOTO encourages consumers to recycle their used lavatory and lavatory parts. Contact your local municipality for recycling programs.

How we're making it healthier

The EcoPower technology enables the flush valve to operate off the energy grid and requires no routine battery replacement. This technology helps to reduce pollution and hazardous waste, thereby mitigating human health impacts.

How we make it greener

EcoPower® HE Toilet Flush Valve

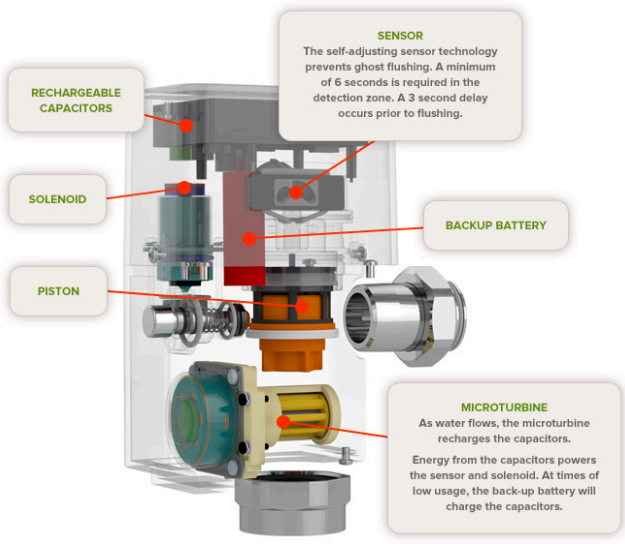
Expand all

CONSTRUCTION

TOTO participates in the UPS Carbon Neutral program. TOTO is a certified SmartWay® Transport Partner.

USE

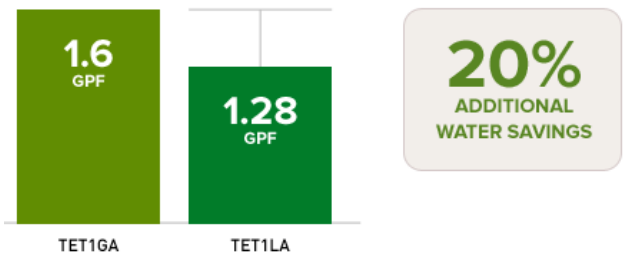
TOTO's EcoPower® Toilet Flush Valves feature the highly regarded EcoPower technology. Engineered to reduce environmental impacts, TOTO's EcoPower products offer water and energy savings without sacrificing performance. Below are some of the features of TOTO's EcoPower technology.



SENSOR:
Ensuring that water flows only when needed, the self-adjusting EcoPower sensor eliminates "ghost" flushing that wastes water. A minimum of six seconds in front of the sensor is required to get its acknowledgement, and a three second flush delay after stepping away from the sensing zone prevents excessive flushing.

MICROTURBINE:
TOTO's EcoPower technology enables the product to operate 100% off grid. As water flows, the microturbine recharges capacitors for the sensor and solenoid. Less reliance on the back-up battery results in much less battery waste.

SOLENOID AND PISTON:
The piston and solenoid mechanism, a marked improvement over traditional rubber diaphragm type valves, maintains consistent flush volume under a range of supply pressures.



Using the same proven engineering as our legendary EcoPower TET1GA, the TET1(6)LB(X) high-efficiency toilet flush valve reinforces TOTO's performance reputation while offering an additional water savings.

Metal and electronic parts can be recycled at the end of life.
