Scope and summary

Sustainable Minds®

Transparency Report (EPD)

LCA results & interpretation

Cradle to gate Cradle to gate with options Cradle to grave

## **Functional unit**

One commercial urinal in an average commercial environment. The expected service life (ESL) of a building is 75 years, and all use stage activity and impacts are accounted for in that full ESL period. The reference service life (RSL) of the urinal is 30 years, which is an industry-accepted average lifespan based on the economic lifespan of the product.

## **Maintenance**

Regular cleaning is assumed to use 1.69 fl oz (50mL) of a 1% sodium lauryl sulfate (SLS) solution daily for 75 years, which is building estimated service life. The use of 50mL/day over 260days/year for 75 years gives a total of 975L of solution. Using a density of 1.01kg/L for a 1% SLS solution, 985kg of solution will be needed over the course of 75 years. Therefore, 9.8kg of SLS plus 975kg of water were included in the model.

## Replacement

An additional 1.5 products are included as replacements, with all life cycle modules considered, over the building's ESL of 75 years.

### Manufacturing data Manufacturing data has been collected and compiled for TOTO Indonesia. Data

## All life cycle stages

What's causing the greatest impacts

## The use stage [B1-B7] dominates the results for all impact categories. The

replacements module [B4] is highly dominant in all categories because of the necessity to consider an additional 1.5 products as replacements. All life cycle modules are considered throughout the estimated service life (ESL) of the building, which is 75 years. The production stage [A1-A3] itself is slightly significant but does not dominate in any impact category. Additionally, the processes associated with dismantling the product and final waste treatment during the end-of-life stage do not have a significant impact.

Production stage [A1-A3]

except for ozone depletion, non-carcinogenics, and eutrophication. The brass parts together with the injection molding process have dominant contributions to the ozone depletion, non-carcinogenics, and eutrophication impact categories. The remaining parts and processes contribute between 4% and 23% of the overall impacts in the rest of the categories. The entire production stage itself accounts for 18% of the global warming potential impact category. Construction stage [A4-A5]

The ceramic parts dominate all impact categories in the production stage

## Transportation by truck for delivery to the installation site contributes the

most, and this stage contributes to approximately 3% of the total global warming potential impacts throughout the product's life cycle. Use stage [B1-B7]

Installation of the product dominates impacts in the construction stage.

## itself dominates all impact categories (>75%) due to the consideration of an

%WT.

83%

11%

Total impacts = 50.6 mPts per 75 years installed additional 1.5 products as replacements. End-of-life stage [C1-C4] The transportation to landfill dominates impacts in the end-of-life stage.

**Product replacements dominate impacts in the use stage.** The use stage

## Transportation and the processes for dismantling the product contribute to a

relatively low portion of global warming potential (~0.2%) but account for approximately 14% of smog formation.

## performance EcoPower® reduces water consumption in the use phase

# ISO 14025, "Sustainability in buildings and civil engineering works -- Core

2.1.

## rules for environmental product declarations of construction products and services"

Sustainable Minds Part A.

**LCA Background Report** 

ISO 21930:2017, "Sustainability in Building Construction — Environmental Declaration of Building Products" serves as the core PCR along with

LCA background report of TOTO sanitary ceramic products, 2024; SimaPro

Analyst 9.5; ecoinvent v3, Industry data 2.0, and US-EI 2.2 databases; TRACI

August, 2023. PCR review conducted by the Sustainable Minds TAB, tab@sustainableminds.com.

AGÉCO); Rebe Feraldi, LCACP, CLAR (Pacific Northwest National Laboratory).

March, 2024. PCR review conducted by Jack Geibig, Chair (Ecoform) Jgeibig@ecoform.com; Hugues Imbeault-Tétreault, ing., M.Sc.A. (Groupe

SM Part A: LCA calculation rules and report requirements, version 2023

## **Download PDF** SM Transparency Report/EPD SM Transparency Reports (TR) are ISO 14025 Type III environmental declarations (EPD) that enable purchasers and users to compare the potential environmental performance of products

SM Part B: Commercial urinals, v3.0

on a life cycle basis. They are designed to present information transparently to make the limitations of comparability more understandable. Environmental declarations of products that conform to the same PCR and include the same life cycle stages, but are made by different manufacturers, may not sufficiently align to support direct comparisons. They therefore cannot be used as comparative assertions unless the conditions as defined in ISO 14025 Section 6.7.2.

'Requirements for Comparability' are satisfied. In order to support comparative assertions, this EPD meets all comparability requirements stated in ISO 14025:2006. However, differences in certain assumptions, data quality, and variability between LCA data sets may still exist. Any EPD

comparison must be carried out at the building level per ISO 21930 guidelines, use the same subcategory PCR where applicable, include all relevant information modules, be limited to EPDs

applying a functional unit, and be based on equivalent scenarios with respect to the context of construction works. Some LCA impact categories and inventory items are still under development and can have high levels of uncertainty. To promote uniform guidance on the data collection, calculation, and reporting of results, the ACLCA methodology (ACLCA 2019) was used.

**Urinal UT105U** 

**EPD** additional content

## **Data**

**Background** This product-specific plant-specific declaration was created by collecting production data from the Indonesia plant. All unit processes were modeled using primary data. Secondary data sources include those available in ecoinvent and USLCI databases. Literature data was used to fill any data gaps to complete the inventory.

In the manufacturing of the products, secondary materials such as scrap metals and metal bars used to hold the primary products in place were partially incorporated in the manufacturing of the primary products but were not considered due to a lack of background data in the LCA model.

based approach in the collected data, which is the most appropriate for the unit processes modeled. Allocation approaches in the background data follow the ecoinvent methodology. No co-product allocations were made in the model.

Cut-off criteria for the inclusion of mass and energy flows are 1% of renewable

primary resource (energy) usage, 1% nonrenewable primary resource (energy)

Allocation Allocations of multi-input and multi-output processes follow a mass-

usage, 1% of the total mass input of that unit process, and 1% of environmental impacts. The total of neglected input flows per module does not exceed 5% of energy usage, mass, and environmental impacts. The only exceptions to these criteria are substances with hazardous and toxic properties, which must be listed even when the given process unit is under the cut-off criterion of 1% of the total mass. Non-ceramic parts in urinals include strainers, hangers and spud nut kits. All

parts with a weight of >1% weight of the parts (excluding ceramic and packaging

materials) are included in the LCA model; no substances considered to be

hazardous or toxic according to local regulations are present in the product. A check has been performed to make sure that the completeness of the overall material use is >98.5wt% of the finished product after cut-off, including the ceramic and packaging materials. Data quality assessment **Precision:** The precision of the data is considered high. Product engineers

### provided detailed bills of materials, and facility managers provided utility information for the manufacturing facilities. The raw material transportation

extracted from the relevant SDS's. Proxy datasets were utilized in the LCA model when secondary data were not available, as shown in Appendix A in the published LCA background report. Completeness: The data included is consider complete. The LCA model included all known material and energy flows. As pointed out in that section, no known flows above 1% were excluded and the sum of all excluded flows totals less than 5%, whether evaluated by mass, energy, or potential environmental

distances were calculated based on the raw material manufacturers' addresses,

impact. Consistency: The consistency of the model is considered high. The bills of materials provided by the product engineers were developed for multiple internal departments use and are maintained regularly. The LCA practitioner also cross-referenced the installation documents and other relevant information

to ensure consistency. Furthermore, modeling assumptions were consistent across the model, with preference given towards SimaPro data, where available. Flow diagram Raw materials

MATERIAL HEALTH

Material evaluation

Self-declared

This environmental product declaration (EPD) was externally verified by Jack Geibig (Ecoform) on behalf of NSF according to ISO 14044; ISO 21930:2017; SM Part A: LCA calculation rules and report requirements, 2023; SM Part B: Commercial Urinals; and ISO 14025:2006.

In accordance with ISO 14044 and the referenced PCR, the life cycle assessment was conducted by Sustainable Minds and critically reviewed by Jack Geibig (Ecoform) on behalf of NSF.

## LCA & material health results & interpretation

**Urinal UT105U** 

Material health

## **Evaluation programs**

### **Declare**

Declare labels are issued to products disclosing ingredient inventory, sourcing, and end of life options. Declare labels are based on the Manufacturers Guide to Declare, administered by the International Living Future Institute.

### How it works

Material ingredients are inventoried and screened against the Living Building Challenge (LBC) Red List which represents the 'worst in class' materials, chemicals, and elements known to pose serious risks to human health and the greater ecosystem.

### Assessment scope and results

### What's in this product and why

### **Declare level**

'Red List Free' is awarded to products when no materials on the Living Building Challenge's Red List are in the product.

### **Red List materials**

No Red List materials are present in the urinal.

### Where it goes at the end of its life

TOTO encourages consumers to recycle their used urinal and urinal parts. Contact your local municipality for recycling programs.

### How we're making it healthier

This commercial urinal is designed to be used with the TOTO **EcoPower® Urinal Flush Valve.** The EcoPower technology enables the flush valve to operate off the energy grid, and it requires no routine battery replacement. This technology helps to reduce pollution and hazardous waste, thereby mitigating human health impacts.

Collapse all

## PRODUCTION

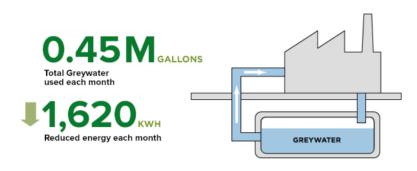

Waste heat from the kilns is routed to the product dryer. This reduces 15% natural gas consumption.

TOTO is taking additional steps at its other facilities, outside of Vietnam and Indonesia, to reduce potential environmental impacts. For example, TOTO's Morrow plant matches 100% of its electricity usage through Georgia Power Simple Solar and helps grow solar energy. 14 million kilowatt hours of green energy helps reduce 18.5 million pounds of carbon dioxide equivalents each year.

In another example of TOTO's energy savings outside of Vietnam and Indonesia, 0.45 million gallons per month of greywater is used in TOTO Morrow's operations. 1,620 of kWh in energy per month is reduced due to less potable water.

65% of all cardboard used is 100% recycled content.

## CONSTRUCTION

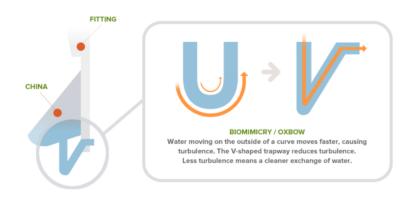

UPS parcel shipments are carbon neutral. TOTO is a registered SmartWay® Transport Partner.

USE

Designed to work in combination with the EcoPower® Ultra High-Efficiency Urinal Flush Valve, the urinal was engineered to utilize biomimicry, modeled after the oxbow affect found in nature. Water moving on the outside of a curve will move faster, causing turbulence. The 0.125gpf urinal utilizes a V-shaped trap to reduce turbulent flow, resulting in lower water use without compromising performance.

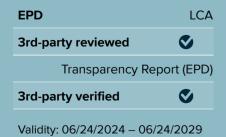

Designed to work in combination with the EcoPower® Ultra High-Efficiency Urinal Flush Valve, the 0.125gpf urinal reinforces TOTO's performance reputation while offering an additional water savings.
